# RECAP

Let's dive right into it

## 1. Max Rewards - I

We've to travel for the  $N^{^{\text{next}}}$  days. There are  $N$  cities to travel to. On each day, we can visit only 1 city. (Note that 1 city can be visited on 2 or  $m^{^{\text{more}}}$  days as well)

Assume that cost of travel is 0. Assume that you just teleport from 1 city to another.

for each particular day & city, there is a reward that you'll get if you go to that city on that particular.

You're basically given a 2D array  $\text{rew}[N][N]$  where  $\text{rew}[i][j]$  represents the no. of reward points you'll earn if you go to  $j^{\text{th}}$  city on  $i^{\text{th}}$  day.

Find the maximum possible total reward points that we can earn.

Constraints:

$$1 \leq N \leq 10^3$$

$$1 \leq \text{rew}[i][j] \leq 10^6$$

N = 5

1 5 1 4 2

5 1 4 2 10

ans = 22

1 1 1 1 1

2 2 2 2 2

3 1 2 4 0

# Intuition

Be greedy!

## Solution

Take max from each row &  
keep holding.

Let's implement

Fixed Cost  $C$

## 2. Max Rewards - II

$(i^{\text{th}})$  city  $j_1$   
 $\Downarrow$   
rew[i][j<sub>1</sub>]

$j_1 \neq j_2$   
=====  $\Rightarrow$   
 $\Downarrow$   
Cost = C  
 $(i+1)^{\text{th}}$  city  $j_2$   
rew[i][j<sub>2</sub>]

$(i^{\text{th}})$  city  $j$   
 $\Downarrow$   
rew[i][j]

=====  $\Rightarrow$   
Cost = 0  
 $(i+1)^{\text{th}}$  city  $j$   
 $\Downarrow$   
rew[i+1][j]

$$N=5, C=10$$

1 5 1 4 2

5 1 4 2 10 ans = 15

1 1 1 1 1

2 2 2 2 2

3 1 2 4 0

## Intuition

$f(i, j)$   $\Rightarrow$  Represents the max. reward that  
 $(dp[i][j])$  we can earn till the  $i^{th}$  day  
given that on  $i^{th}$  day, we travel  
to the  $j^{th}$  city only.

$(i, j)$

Come from  $j^{\text{th}}$  city  
only on  $(i-1)^{\text{th}}$  day

A different city

$$dp[i][j] = INT-MIN;$$

for (int  $k=0; k < N; ++k$ ) if ( $j \neq k$ )  
     $dp[i][j] = \max(dp[i][j], dp[i-1][k] +rew[i][j])$   
else  $dp[i][j] = \max(dp[i][j], dp[i-1][k] - C + rew[i][j])$ ;

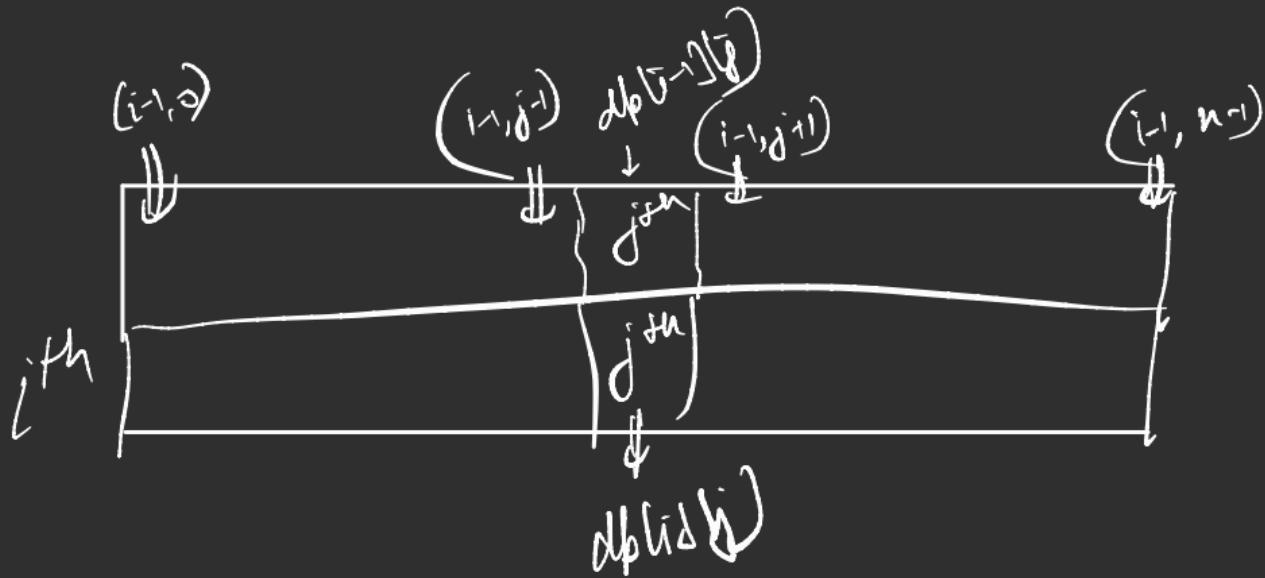

ans = INT-MIN;

for(j=0; j < N; ++j)

ans = max(ans, d[i][N-1][j]);

return ans;

Overall Time  $\Rightarrow O(N^3)$

$$db[i-1][j] + \text{rew}[i][j]$$

$$db[i-1][0] + \text{rew}[i][0] - c$$

$$\left. \begin{array}{c} \\ \\ \end{array} \right\}$$

$$db[i-1][j+1] + \text{rew}[i][j] - c$$

$$\left. \begin{array}{c} \\ \\ \end{array} \right\}$$

$$db[i-1][j-1] + \text{rew}[i][j] - c$$

$$db[i-1][n-1] + \text{rew}[i][j] - c$$

$$\left. \begin{array}{c} \\ \\ \end{array} \right\}$$

$(i, j)$

Come from  $j^{\text{th}}$  city  
only on  $(i-1)^{\text{th}}$  day

A different city

$$\text{poss1} \sim db[i-1][j] + \\ rwo[i][j]$$

$$\text{poss2} \sim$$

# Solution

Let's implement

### 3. Max Rewards - III

The cost is not fixed.

$$(i, j_1) \xrightarrow{j_1 \Rightarrow j_2} (i+1, j_2)$$

$$\text{cost} = \text{abs}(j_1 - j_2)$$

N.5

1      5      1      4      2

5      1      4      2      10

1      1      1      1      1

2      2      2      2      2

3      1      2      4      0

ans = 19

## Intuition

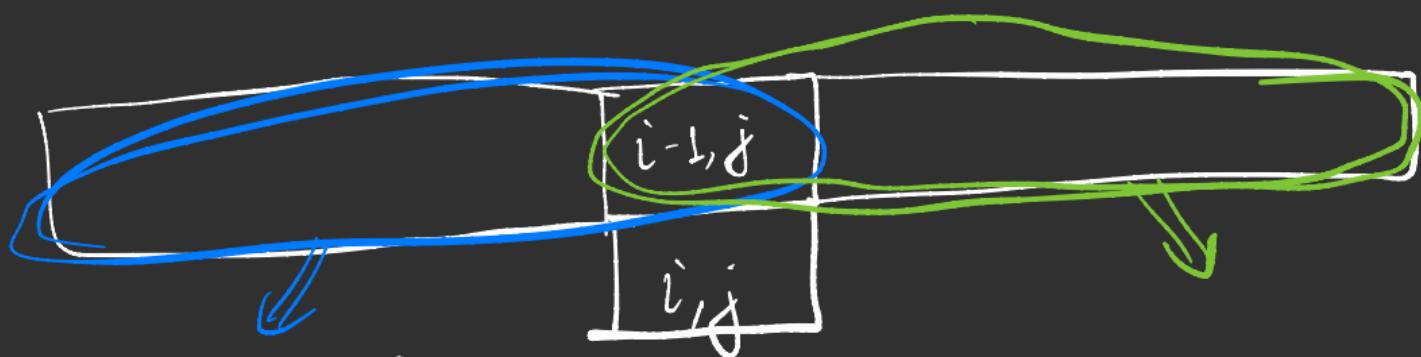

$dp[i][j] \Rightarrow$  coming from city  $k$ .

$$rew[i][j] + dp[i-1][k] - abs(k-j)$$

if ( $k \leq j$ )

$$(rew[i][j] - j) + (dp[i-1][k] + k)$$

$$\text{if } (k \geq j) \\
 (rew[i][j] + j) + (dp[i-1][k] - k)$$

$$\max_{(k \leq j)} ((dp[i-1][k] + k))$$

$$\max (dp[i-1][k] - k) \quad k \geq j$$

$$\text{poss1} = \text{rew}[i][j] - j + \text{pre}[i-1][j]$$

$$\text{poss2} = \text{rew}[i][j] + j + \text{suf}[i-1][j]$$

$$\text{dp}[i][j] = \max(\text{poss1}, \text{poss2});$$

# Solution

Let's implement

# *Thank You!*

Reminder: Going to the gym & observing the trainer work out can help you know the right technique, but you'll muscle up only if you lift some weights yourself.

So, PRACTICE, PRACTICE, PRACTICE!
